

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

ENGLISH CLASSICS,

FOR

Classes in English Literature, Reading, Grammar, etc.

EDITED BY EMINENT ENGLISH AND AMERICAN SCHOLARS.

Each Volume contains a Sketch of the Author's Life, Prefatory and Explanatory Notes, etc., etc.

These Volumes are thoroughly adapted for Schools in which English Literature forms a branch of study, or where a carefully-selected portion of some English Classic is selected for minute examination, or for supplementary reading matter. The notes are unusually full and exhaustive, occupying in many volumes nearly half the book. Etymology is attended to throughout, the derivations of all the more difficult words being given. In short they supply the student with all the information necessary to a perfect understanding and just appreciation of the text, and incidentally communicate much useful philological and general knowledge. They are all well printed, on fine paper, from large type, and are attractively bound with paper covers.

- 1 Byron's *Prophesy of Dante*. (Cantos I. and II.)
- 2 Milton's *L'Allegro and Il Penseroso*.
- 3 Lord Bacon's *Essays, Civil and Moral*. (Selected.)

NOTE.

Why should teachers want a Key, it is asked. It looks suspicious, says one. If they cannot solve the examples, they are not qualified for their station, adds another.

The character and scholarship of those who suggested the present work, are above suspicion. They desire it, not because they cannot solve the examples, but to *expedite the detection of errors*; they wish it, not because they shrink from toil, but to *save time*, which they wish to devote to illustrations and exercises upon the blackboard.

It is easy to see that the labor of discovering a mistake of a pupil by going through the whole of a long operation, might consume an *hour*, while a well-constructed Key would disclose it to the teacher in a *single minute*.

The plan of the work is to indicate the operations and give the results, omitting the minor details. It is hoped teachers will find it adapted to their wants.

NOTE.—The *true* multiplicand, in this and all practical examples, is that number which, added to itself a given number of times, will produce the *required product*. The reasoning in the analysis should always be based upon this fact. (Art. 40.)

But in the operation, it is customary to take the *smaller* number for the multiplier. In such cases great care should be taken to apply to the *product* the *name* of the *true* multiplicand. (Arts. 45, N., 46.)

16. The numbers 250 and 500 are factors of 1000.

$5)250, 500, 1000$

Ans. 1000.

17. ANALYSIS.—It is plain any sum which is a *common* multiple of the several prices will buy an exact number of each. Hence, the *least common* multiple of the several prices must be the *least sum* which will buy an exact number of each. Now the least common multiple of 4, 6, and 10 is 60.

Ans. 60 cts.

$2, 3, 5, 1$

Ans. $2 \times 2 \times 2 \times 3 \times 2 \times 3 \times 5 = 720$ rows.

19. In this example 4 and 6 are factors of 12. We therefore cancel them. 5 and 12 are prime to each other.

Thus, $\frac{4, 5, 6, 12}{5 \times 12 = 60 \text{ lbs.}} \text{ Ans.}$

7. NOTE.—In multiplying by the fractional part of a mixed number, it is often convenient to divide the multiplicand by the denominator, and setting the quotient under the product of the integral part, multiply it by 1 less than the numerator. Thus,

49. 1 day is $\frac{1}{8}$ of 8 days;
therefore in 1 day A will
do $\frac{1}{8}$ of the job. For the
same reason, B will do $\frac{1}{6}$
in 1 day. Now $\frac{1}{8}$ and $\frac{1}{6}$
are $\frac{7}{24}$. Ans.

50. $4 \times 20 = 80$; $9 \times 16 = 144$

$\frac{144}{80} = \frac{9}{5}$. *Ans.*

51. $\frac{195}{25} \div 75 \times 18 =$

$\frac{7}{185} \times \frac{1}{75} \times 18 = \frac{7}{2250}$.

52. $68 - 24 = 44$;

$44 \times 14 = 616$;

$168 \div 12 = 14$;

$14 \div 616 = \frac{14}{616} = \frac{1}{44}$.

Page 137.

1, 2. Given.

3. $56 \div \frac{2}{3} = 16 \times \frac{3}{2} = 84$.

4. $68 \div \frac{3}{4} = 68 \times \frac{4}{3} = 90\frac{2}{3}$.

5. $85 \div \frac{2}{3} = 85 \times \frac{3}{2} = 127\frac{1}{2}$.

6. $115 \div \frac{5}{6} = 115 \times \frac{6}{5} = 138$.

7. $436 \div \frac{3}{4} = 436 \times \frac{4}{3} = 1017\frac{1}{3}$.

8. $456 \div \frac{5}{8} = 456 \times \frac{8}{5} = 729\frac{3}{5}$.

9. $685 \div \frac{3}{10} = 685 \times \frac{10}{3} = 2283\frac{1}{3}$. *Ans.*

10. $999 \div \frac{7}{16} = 999 \times \frac{16}{7} = 2283\frac{3}{7}$. *Ans.*

11. $126 \div \frac{1}{15} = 126 \times \frac{15}{1} = 270$ eggs. *Ans.*

12. $8280 \div \frac{9}{16} = 8280 \times \frac{16}{9} = \14720 . *Ans.*

13. $\frac{7}{8} - \frac{5}{8} = \frac{2}{8}$. Hence, $\frac{1}{4} = 9500 \div 2$, or 4750, and $\frac{7}{8} = 4750 \times 7$, or 33250 men. Or $9500 \div \frac{2}{7} = 9500 \times \frac{7}{2} = 33250$ men. *Ans.*

14, 15. Given.

16. Since $\frac{35}{96}$ is $\frac{5}{3}$ of a certain number, that number must be equal to as many units as $\frac{5}{3}$ is contained times in $\frac{35}{96}$; and

$\frac{35}{96} \div \frac{5}{3} = \frac{35}{96} \times \frac{3}{5} = \frac{7}{32}$. *Ans.*

17. Analyzed as above, we have $\frac{7}{32} \div \frac{8}{5} =$

$\frac{6,72}{12,96} \times \frac{8}{5} = \frac{8}{5}$, or $1\frac{3}{5}$.

18. Given.

19. $37\frac{1}{2} = 75$,

$75 \div \frac{3}{4} = \frac{75,25}{2} \times \frac{4}{3} = 125$. *Ans.*

20. $66\frac{2}{3} = \frac{200}{3}$; $\frac{200}{3} \div \frac{4}{5} =$

$\frac{50,200}{3} \times \frac{5}{4} = 2083\frac{1}{3}$.

21. Given.

Page 138.

22. $\frac{7}{8}$ of $\frac{4}{5} = \frac{28}{40}$ or $\frac{7}{10}$. Now, $112 \div \frac{7}{10} = 112 \times \frac{10}{7} = 288$. *Ans.*

23. Given.

24. $\frac{7}{8}$ of \$100 = \$700; $\$700 \div \$9 = 91\frac{1}{3}$ yds. *Ans.*

25. $\frac{2}{10}$ of \$280 = \$252; $\$252 \div 84 = \3 . *Ans.*

DIVISION OF DECIMALS.

Page 153.

1. Given.

2. NOTE.—In division of decimals, it is advisable for beginners to reduce the divisor and dividend to a *common denominator*, as directed by the first method. This is not only the simplest, but the only way by which the majority of learners can be led

to an understanding of the reasons for pointing off the quotient.

31. NOTE.—This example has this peculiarity: The sum of the lower denominations is equal to a unit of the highest; and yet the value of each of these terms is less than that of the next higher.

Thus, 1 ft. + 6 in. = $\frac{1}{2}$ yd.;

$\frac{1}{2}$ yd. + 5 yds. = $5\frac{1}{2}$ yds., or 1 r.;

1 r. + 39 r. = 40 r., or 1 fur.;

1 fur. + 7 fur. = 8 fur., or 1 m. Hence,

1 m. + 7 fur. + 39 r. + 5 yds. + 1 ft. + 6 in. = 2 m.

126720 in. *Ans.*

PROOF.—126720 in. = 2 miles.

The denominations given may be obtained thus:

2 miles = 1 m. + 1 m.

Now 1 m. = 7 fur. + 1 fur.; 1 fur. = 39 r. + 1 r.; 1 r. = 5 yd. + $\frac{1}{2}$ yd.; $\frac{1}{2}$ yd. = 1 ft. 6 in.

Hence, 126720 in. = 1 m. 7 fur. 39 r. 5 yd., 1 ft. 6 in.

Problem I. Page 233.

NOTE.—The Problem to find the *Percentage*, when the Base and Rate are given, we have seen, is the same in principle as finding a *fractional part* of a number, or *multiplying* by a *common* or *decimal fraction*. (Art. 336, N. 3.) This relation or identity should be illustrated by solving several examples by each method in succession. Thus,

1st. To find a *given per cent* of a number. (Art. 336.)

What is 4% of 1200?

ANALYSIS.—4% is .04; hence, 4% of 1200 = .04 times 1200, and $1200 \times .04 = 48.00$. Ans.

2d. To find a *fractional part* of a number. (Art. 143.)

How many are $\frac{4}{100}$ of 1200?

ANALYSIS.— $\frac{4}{100}$ of 1200 = 4 times $\frac{1}{100}$ of 1200. Now $\frac{1}{100}$ of 1200 = $\frac{1200}{100}$, and $\frac{1200}{100}$ are 4 times $\frac{1200}{100} = \frac{4800}{100}$, or 48, the same as above.

3d. To *multiply* by a common or a decimal fraction. (Arts. 165, 191.)

What is the product of 1200 multiplied by $\frac{4}{100}$ or by .04?

SOLUTION.— $1200 \times \frac{4}{100} = \frac{4800}{100} = 48$, the same as before.

And $1200 \times .04 = 48.00$, the same as before.

Problem III. Page 237.

NOTE.—The Problem to find the *Rate*, when the *Base* and *Percentage* are given, or to find what *per cent* one number is of another, we have seen, is the same in principle as finding *what fractional part* one number is of another, then changing the fraction to *hundredths*. (Art. 339, N. 1.)

1st. To find the *Rate*, or what *per cent* one number is of another.

What *per cent* of 40 is 8?

ANALYSIS.—Here 40 is the base, and 8 the percentage. Now 8 is $\frac{8}{40}$ of 40, and $8 \div 40 = .20$, or 20%.

Or, thus : Since 40, the base, is 100% of itself, 1 which is $\frac{1}{40}$ of 40, must be $\frac{1}{40}$ of 100%, and 8 is 8 times $\frac{1}{40}$ of 100%, or $\frac{8}{40}$ of 100%; and $100\% \times \frac{8}{40} = \frac{800}{40}$, or 20%.

2d. To find *what fractional part* one number is of another.

What part of 40 is 8?

ANALYSIS.—8 is $\frac{8}{40}$ of 40; and $\frac{8}{40} = \frac{20}{100}$, or .20. (Arts. 150, 173.)

But the common fraction $\frac{20}{100}$ and the decimal .20 are each equal to 20%, the same as before.

$$7 \text{ qts.} \div 224 = .031\frac{1}{8} \text{ or } 3\frac{1}{8}\%.$$

$$8. \ \$5 = 50 \text{ dimes.}$$

$$5 \text{ dimes} \div 50 = 10\%.$$

$$9. \ \frac{1}{2} \text{ T.} \div \frac{5}{8} \text{ T.} = \frac{4}{5} = 80\%.$$

$$10. \ 9 \text{ parts} + 1 \text{ part} = 10 \text{ p'rts.}$$

The question then is, what percent of 10 is 1?

$$\text{Now } 1 \div 10 = .10 \text{ or } 10\%.$$

$$11. \ 15 \text{ gal.} \div 63 \text{ gal.} = 23\frac{1}{3}\%.$$

Problem IV. Page 238.

NOTE.—The Problem to find the *Base*, when the Percentage and Rate are given, we have seen, is the same in principle as finding a number, when a *fractional part* of it is given. (Art. 340, N. 1.)

1st. To find the *base*, when a percentage of it is given.

60 is 20% of what number?

ANALYSIS.—Since 60 is 20% of a certain number, 1% of that number must be $\frac{1}{20}$ of 60, which is 3, and 100%, 100 times 3, or 300. Therefore 60 is 20% of 300.

2d. To find a number, when a *fractional part* of it is given. (Art. 174.)

60 is $\frac{20}{100}$ of what number?

ANALYSIS.—Since $\frac{20}{100}$ of a certain number is 60, 1 hundredth is $\frac{1}{10}$ of 60, which is 3, and $\frac{100}{20} = 3 \times 100 = 300$, the same as above.

Or $\frac{30}{100} = \frac{1}{3}$. Now since 1 fifth of a certain number is 60, 5 fifths must be 5 times 60, which is 300, the same as before.

 $\frac{1618}{3} \div \frac{2}{3} = \frac{1618}{2} = 809$.
Or, by Analysis, $539\frac{1}{3} = \frac{2}{3}$ of the number. Then $\frac{1}{3}$ of it is $539\frac{1}{3} \div 2 = 269\frac{2}{3}$, and $\frac{2}{3}$ or the whole is $269\frac{2}{3} \times 3 = 809$. *Ans.*

37. ANALYSIS.—First find the interest on the Bonds. The income \$1350 includes the 6% interest (gold) on the Bonds and $12\frac{1}{2}\%$ premium on the gold. But the interest is 100% or $\frac{100}{100}$ of itself, and the premium $12\frac{1}{2}\%$ or $\frac{12\frac{1}{2}}{100}$; and $\frac{100}{100} + \frac{12\frac{1}{2}}{100} = \frac{112\frac{1}{2}}{100}$.
 Hence, the interest is $\frac{112\frac{1}{2}}{100}$ of \$1350. Now $\frac{100}{112\frac{1}{2}}$ of \$1350 = \$1350 $\div 112\frac{1}{2}$ or \$12, and $\frac{100}{112\frac{1}{2}}$, 100 times \$12 or \$1200 (gold). Again, if \$1 gold yields 60 cents, \$1200 gold will yield 1200 times 60 cents or \$720, and \$720 + \$1200 = \$1920, the income required.
 Or, $112\frac{1}{2} : 100 :: \$1350 : \$1920.$ *Ans.*

Or, since 800 yds. are required of $\frac{3}{4}$ or $\frac{6}{8}$ yd. wide, it
would take of $\frac{1}{8}$ yd. wide 6 times 800 or 4800 yds. to
supply 100 men. But at $\frac{7}{8}$ yd. wide, it requires $\frac{1}{7}$ of
4800 or 685 $\frac{5}{7}$ yds. for 100 men.

Again, if 100 men require 685 $\frac{5}{7}$ yds, 1500 men will

Or, if in 10 d. 75 m. build 1200 cu. ft., in 1 d. they build $\frac{1}{10}$ of 1200, or 120 cu. ft. And if 75 m. build 120 cu. ft. in 1 d., 1 man would build $\frac{1}{75}$ of 120, or $1\frac{1}{3}$ cu. ft. per day. Again, 100 m. would build $1\frac{1}{3} \times 100$, or 160 cu. ft. per day. Now if freight is $\frac{4}{55}$ per ton, 40 tons will cost $\frac{4}{55} \times 40 = 2\frac{16}{11}$ per mile, and for 500 m. the cost will be $2\frac{16}{11} \times 500 = 1454\frac{6}{11}$. *Ans.*

Or, 18 sofas are made by 9 m. in 30 d. of 10 h., or in 300 hrs. If 9 m. work 300 hrs. to make 18 sofas, 1 m. must work 9 times 300, or 2700 hours. And if 18 sofas require 1 m. 2700 hrs., 1 sofa would be made in $\frac{1}{18}$ of 2700, or 150 hrs.

Now, if 1 m. can make 1 sofa in 150 hrs., 50 m. can make 50 sofas in the same time, and in 720 hrs. (90 d. of 8 h. each) they can make $\frac{720}{150}$, or $4\frac{4}{5}$ times $50 = 240$ sofas. *Ans.*

10 in. sq. = 100 sq. in. in each tile.

Since the bricks required to cover the court-yard contain 288000 sq. in., and 1 tile contains 100 sq. in., it will take as many tiles to cover it as 100 is contained times in 288000, or 2880 tiles. And since the yard contains 2000 sq. ft., $\frac{1}{10}$ of 2880, or 144 tiles, would cover 100 sq. ft. The hall contains $75 \text{ ft.} \times 8 \text{ ft.} = 600$ sq. ft. sults in Col. 1 opposite the corresponding prices compared. In like manner, we find 1 lb. of the 2d is required to *gain*, and $\frac{1}{2}$ lb. of the 3d to *lose* a unit of the mean price. Place these results in Col. 2 opposite the corresponding prices. Finally, reduce the numbers in Cols. 1 and 2 to a common denominator separately, placing the results in Col. 3; or, we may multiply each of them by 6, the least common denominator, and place the results in Col. 4. The proportional parts in Cols. 3 and 4 answer the conditions. Hence, the

RULE.—I. Write the prices of the ingredients in a column in their order, with the mean price on the left.

II.—Taking them in pairs, one less and the other greater than the mean price, find how much is required of one article to *GAIN* and of the other to *LOSE* a unit of the mean price, and set the results in Col. 1 opposite to the corresponding prices compared. Compare the other couplets in like manner, setting the results of each in a separate column.

III.—Finally, reduce the numbers in each column to a common denominator separately: the results will be the proportional parts required.

Or, multiply the numbers in all the columns by the least common multiple of their denominators, and the results will be the proportional parts required.

10. There are but 3 ingredients in this example; we therefore compare the one less than the mean price with each of the others; the sum of the numbers standing opposite = 3. NOTES.—1. Since he made a profit of 10 cts. a lb. by selling the mixture at 42 cts., the mean *cost* of it was $42 - 10 = 32$ cts.

2.—Reducing columns 1 and 2 to a common denominator, we have column 3. Multiplying column 3 by 2, 3, 4, etc., gives columns 4, 5, 6, etc.

Again, if the proportional parts of one couplet are multiplied or divided by one number, and those of the other couplet by any other number, the results will answer the conditions.

13. ANALYSIS.—10 bu. oats at 30 cts. = \$3, and 20 bu. rye at 60 cts. = \$12. But 10 bu. + 20 bu. = 30 bu., and \$3 + \$12 = \$15. Now \$15 ÷ 30 = 50 cts.; therefore, the mean value of 30 bu., the sum of the two ingredients given, is 50 cts. The question now is, how much of each of the other two kinds must be mixed with 30 bu. at 50 cts. to

make a mixture worth 55 cts. a bu.? The ratio of the sum of the given ingredients, 30 bu., to

OPERATION.

$$55 \left\{ \begin{array}{l} 40 \\ 50 \\ 80 \end{array} \right. \begin{array}{l} 25 \times \frac{5}{2} = 30 \\ 25 \times \frac{5}{2} = 30 \\ 15 + 5 = 20 \times \frac{5}{2} = 24 \end{array}$$

its proportional part, 25 bu., is 30 to 25, or $\frac{6}{5}$. Therefore, multiplying each part found by this ratio, we have 30 bu. of barley at 40 cts. and 24 bu. of corn at 80 cts. to be mixed with 30 bu. at 50 cts., or with 10 bu. at 30 cts. and 20 bu. at 60 cts.

14. The proportional parts are 5 lbs. each at 40 cts., 45 cts., and 50 cts. respectively, and 45 lbs. at 65 cents. But this last quantity is limited to 30 lbs. The ratio of 30 to 45 = $\frac{2}{3}$. Multiplying each of the other results, we have $3\frac{1}{3}$ lbs., at 40, 45, and 50 cts. *Ans.*

15. In finding the proportional parts, we set down the value of the water as 0. Then the parts are 1 qt. water, 1 qt. at 4 cts. and 6 qts. at 6 cts. But the ratio of the given quantity of water to the part found is 50 to 1 or 50. Multiplying as before, we have 50 qts. at 4 cts. and 300 qts. at 6 cents. *Ans.*

$2 \times 6 = 12 + 3 = 15.$ *Ans.*

3. $3 \times 9 = 27.$

$35 - 27 = 8.$ *Ans.*

5. NOTE.—The principal is the first term of an arithmetical series; the amount, the last term; the interest for 1 year, the common difference; and the number of years plus 1, the number of terms.

For, since the principal is the first term, the second term is the principal plus the interest for 1 year; hence, the number of terms

must be 1 greater than the number of years.

1. Since there are 6 terms, the ratio 2 must be raised to the 5th ($6 - 1$) power. Now $2^5 = 2 \times 2 \times 2 \times 2 \times 2 = 32$. Hence, the last term $= 3 \times 32 = 96$. *Ans.*
2. The ratio is 2; the number of terms 10, and $10 - 1 = 9$; therefore the ratio 2 must be raised to the 9th power, and $2^9 = 512$. Hence,
The last term $= 2 \text{ cts.} \times 512 = \10.24 . *Ans.*
3. The amount of \$1 for 1 year, at 6% $= \$1.06$. Therefore, \$1500 is the first term, 1.06 the ratio, and 5 the number of terms. (Art. 567, N. 3.)
 $(1.06^5) = 1.3382255776$; $\$1500 \times 1.3382255776 = \2007.3383664 , at 5%. *Ans.*
 $(1.07)^6 = 1.500730351849$; $\$2000 \times 1.500730351849 = \3001.460703698 , at 6%. *Ans.*

Page 354.

4. Assuming the series to be ascending, the first term is 2, and the last 162, and 162×3 (the ratio) $= 486$.
Now, $486 - 2 = 484$, and $484 \div 2 = 242$, the sum of the series. *Ans.*
5. $972 \times 3 = 2916$; $2916 - 4 = 2912$; $2912 \div 2 = 1456$.
6. Here are *two steps*: First, to find the last term; second, to find the sum of the terms. (Arts. 567, 568.)
The ratio is 2; the number of terms 12, and $12 - 1 = 11$.
Now $2^{11} = 2048$, and $1 \times \$2048 = \2048 , the last term.
Again, $\$2048 \times 2 = \4096 . But $\$4096 - 1 = \4095 ; and $\$4095 \div 1 = \4095 , the sum paid. *Ans.*
7. The ratio being $\frac{1}{2}$, the difference between the ratio and 1 is $\frac{1}{2}$.
Then the first term $\frac{2}{3} \div \frac{1}{2} = \frac{2}{3} \times \frac{2}{1} = \frac{4}{3} = 1\frac{1}{3}$. *Ans.*

ANALYSIS. — Each ship will return to New York, the starting point, in every number of days that is a multiple of the days in its trip; hence, all will meet at New York in every number of days that is a common multiple of their respective trips. Therefore, the time of their first meeting must be the least common multiple of their respective trips.

The least common mult. of 10, 12, and 16 is 240.

 $\sqrt{3600} = 60$ ft., hyp. of 1st and base of 2d triangle.

43. Since B was \$50 in debt in 5 years, he ran behind \$10 a year. Spending \$40 a year more than A, who saved $\frac{1}{4}$, it follows that \$40 was \$10 more than $\frac{1}{4}$ of their salary; hence, $\frac{1}{4}$ salary = \$40 - \$10, or \$30. Now if $\frac{1}{4}$ = \$30, $\frac{4}{4}$ = 4 times 30, or \$120, salary of each. $\frac{3}{4}$ of \$120 = \$90, the sum A spent. \$90 + \$40 = \$130, the sum B spent.

Or, since A saved $\frac{1}{4}$ of his salary, he spent $\frac{3}{4}$; and since B run in debt \$50 in 5 years, he spent \$10 a year more than his income. Hence, $\frac{3}{4}$ of his salary + \$30 = $\frac{4}{4}$, or the whole salary. Now if $\frac{3}{4}$ + \$30 = $\frac{4}{4}$, $\frac{1}{4}$ = \$30; and $\frac{4}{4}$ = 4 times \$30, or \$120, salary of each. Hence, A spent \$90, B \$130.

New and Thoroughly Revised Edition.

THE GOVERNMENT CLASS BOOK:

A YOUTH'S MANUAL OF INSTRUCTION IN THE PRINCIPLES OF
CONSTITUTIONAL GOVERNMENT AND LAW.

PART I.—Principles of Government: 1, General Principles of Government—2, Government in the State—3, The United States Government. PART II.—Principles of Law: 1, Common and Statutory Law (or Municipal Law)—2, International Law. By ANDREW W. YOUNG, author of "American Statesman," "Citizen's Manual of Government and Law," etc., etc. New edition. Thoroughly revised. By SALTER S. CLARK, Counsellor at Law. 300 pp., 12mo, cloth.

"Our Government, to be loved and cherished as it should be, must be understood; and to be understood, it must be *studied*: and this can only be done, by the masses, in the public free schools of the country. 'The Government Class Book' is a most valuable contribution to this great object, and peculiarly adapted to use in the public schools. A careful study of it will render any young man or woman, of good common sense, perfectly familiar with the fundamental principles of Constitutional, Common, Statutory and International Law, and send them forth to the world with clear perceptions of their rights and duties as citizens, and a love for their country and her institutions, which will be as enduring as life. And who shall say that such a knowledge of political science is not worth a thousand times more than that which is substituted for it in most of the schools and academics of the country?"—Hon. NEWTON BATEMAN, late State Superintendent of Schools, Illinois.

"We hail all such class books as this. We are amazed at the almost utter neglect of training in the science of national self-government which has heretofore characterized the education of 'Young America.' A young prince who should not be specially educated for his coming responsibilities would be a monstrosity, and his guardians would be held culpably accountable. And in this country every youth is heir-apparent. The book before us is admirably systematized, and its arrangement is placed with great distinctness before the eye. The whole is thoroughly practical, and adapted to the purposes of an elementary text-book. And we sincerely hope it may be rewarded by a large sale not only, but by an extended influence in promoting the study of legal and political principles amongst young and old."—*Christian Intelligencer*.

"'The Government Class Book' is especially valuable on account of the prominence which it gives to State Government, and for its closing chapters on general legal facts and principles. It contains *multa in parvo*. Had such a book come into my hands when a boy in the common schools, it would have been held as a priceless treasure. The book is valuable in view of its choice contents, and as a production in the direction of the new education now sought for in our common schools."—Hon. D. DUNT, State Superintendent of Public Instruction, St. Paul, Minn.

Although this revised edition of the above work has been published but a short time it has already been introduced with marked success in hundreds of schools in all parts of the country.

the 1990s, the number of people in the world who are undernourished has increased from 250 million to 800 million.

There are a number of reasons why the world's population is growing so fast. One of the main reasons is that the world's population is becoming younger. In 1990, the world's population was 5.3 billion. By 2000, it was 6.1 billion. By 2010, it is expected to be 6.9 billion. By 2020, it is expected to be 7.6 billion. By 2030, it is expected to be 8.3 billion. By 2040, it is expected to be 8.9 billion. By 2050, it is expected to be 9.6 billion. By 2060, it is expected to be 10.3 billion. By 2070, it is expected to be 10.9 billion. By 2080, it is expected to be 11.5 billion. By 2090, it is expected to be 12.1 billion. By 2100, it is expected to be 12.7 billion.

Another reason why the world's population is growing so fast is that the world's population is becoming more urban. In 1990, 54% of the world's population lived in urban areas. By 2000, 61% of the world's population lived in urban areas. By 2010, 68% of the world's population lived in urban areas. By 2020, 75% of the world's population lived in urban areas. By 2030, 82% of the world's population lived in urban areas. By 2040, 89% of the world's population lived in urban areas. By 2050, 96% of the world's population lived in urban areas. By 2060, 99% of the world's population lived in urban areas. By 2070, 100% of the world's population lived in urban areas. By 2080, 100% of the world's population lived in urban areas. By 2090, 100% of the world's population lived in urban areas. By 2100, 100% of the world's population lived in urban areas.

A third reason why the world's population is growing so fast is that the world's population is becoming more educated. In 1990, 54% of the world's population was illiterate. By 2000, 41% of the world's population was illiterate. By 2010, 28% of the world's population was illiterate. By 2020, 15% of the world's population was illiterate. By 2030, 8% of the world's population was illiterate. By 2040, 4% of the world's population was illiterate. By 2050, 2% of the world's population was illiterate. By 2060, 1% of the world's population was illiterate. By 2070, 0.5% of the world's population was illiterate. By 2080, 0.2% of the world's population was illiterate. By 2090, 0.1% of the world's population was illiterate. By 2100, 0.05% of the world's population was illiterate.

A fourth reason why the world's population is growing so fast is that the world's population is becoming more healthy. In 1990, the world's population had a life expectancy of 53 years. By 2000, the world's population had a life expectancy of 67 years. By 2010, the world's population had a life expectancy of 72 years. By 2020, the world's population had a life expectancy of 77 years. By 2030, the world's population had a life expectancy of 82 years. By 2040, the world's population had a life expectancy of 87 years. By 2050, the world's population had a life expectancy of 92 years. By 2060, the world's population had a life expectancy of 97 years. By 2070, the world's population had a life expectancy of 102 years. By 2080, the world's population had a life expectancy of 107 years. By 2090, the world's population had a life expectancy of 112 years. By 2100, the world's population had a life expectancy of 117 years.

A fifth reason why the world's population is growing so fast is that the world's population is becoming more wealthy. In 1990, the world's population had a GDP of \$2.5 trillion. By 2000, the world's population had a GDP of \$4.5 trillion. By 2010, the world's population had a GDP of \$7.5 trillion. By 2020, the world's population had a GDP of \$11.5 trillion. By 2030, the world's population had a GDP of \$15.5 trillion. By 2040, the world's population had a GDP of \$19.5 trillion. By 2050, the world's population had a GDP of \$23.5 trillion. By 2060, the world's population had a GDP of \$27.5 trillion. By 2070, the world's population had a GDP of \$31.5 trillion. By 2080, the world's population had a GDP of \$35.5 trillion. By 2090, the world's population had a GDP of \$39.5 trillion. By 2100, the world's population had a GDP of \$43.5 trillion.

A sixth reason why the world's population is growing so fast is that the world's population is becoming more mobile. In 1990, 54% of the world's population lived in their birthplace. By 2000, 61% of the world's population lived in their birthplace. By 2010, 68% of the world's population lived in their birthplace. By 2020, 75% of the world's population lived in their birthplace. By 2030, 82% of the world's population lived in their birthplace. By 2040, 89% of the world's population lived in their birthplace. By 2050, 96% of the world's population lived in their birthplace. By 2060, 99% of the world's population lived in their birthplace. By 2070, 100% of the world's population lived in their birthplace. By 2080, 100% of the world's population lived in their birthplace. By 2090, 100% of the world's population lived in their birthplace. By 2100, 100% of the world's population lived in their birthplace.

A seventh reason why the world's population is growing so fast is that the world's population is becoming more diverse. In 1990, 54% of the world's population was of European descent. By 2000, 41% of the world's population was of European descent. By 2010, 28% of the world's population was of European descent. By 2020, 15% of the world's population was of European descent. By 2030, 8% of the world's population was of European descent. By 2040, 4% of the world's population was of European descent. By 2050, 2% of the world's population was of European descent. By 2060, 1% of the world's population was of European descent. By 2070, 0.5% of the world's population was of European descent. By 2080, 0.2% of the world's population was of European descent. By 2090, 0.1% of the world's population was of European descent. By 2100, 0.05% of the world's population was of European descent.

A eighth reason why the world's population is growing so fast is that the world's population is becoming more religious. In 1990, 54% of the world's population was Christian. By 2000, 61% of the world's population was Christian. By 2010, 68% of the world's population was Christian. By 2020, 75% of the world's population was Christian. By 2030, 82% of the world's population was Christian. By 2040, 89% of the world's population was Christian. By 2050, 96% of the world's population was Christian. By 2060, 99% of the world's population was Christian. By 2070, 100% of the world's population was Christian. By 2080, 100% of the world's population was Christian. By 2090, 100% of the world's population was Christian. By 2100, 100% of the world's population was Christian.
